

# Video Verification

Delivering video verified alarm events

## Creating peace of mind and reducing costs through innovation using the trusted video verification service by Permaconn

Permaconn's Video Verification provides Monitoring Centres and Bureau's with an exciting new revenue opportunity for both new and existing customers.

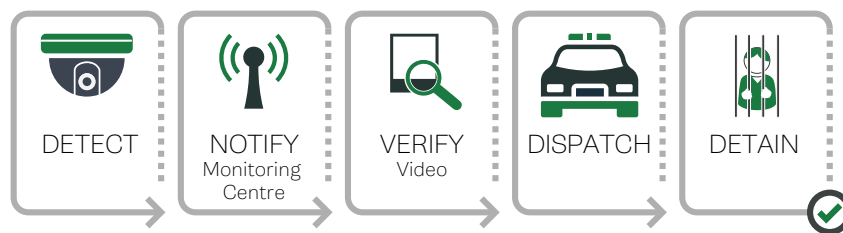

Permaconn's Video Verification service allows operators to quickly access alarm and real-time video events from within their automation software.

### Operation

When an alarm is triggered, the Permaconn Video Verification service will capture a 30-second video clip from the camera nearest the violated alarm zone and deliver it directly to the operator's automation software screen. The operator clicks on the link in the automation software to immediately view the related video clip.

This clip is stored in the Permaconn cloud, and can be immediately retrieved at any time during the next 30 days. After 30-days, the Permaconn service will automatically archive the video for five years to meet the necessary record-keeping regulations.

### Improve protection with Permaconn's video verification solution

### Video Verification provides the following key benefits

- enables faster response to events
- provides greater situation awareness for the operator and respondents
- provides the ability to quickly share burglary footage with police, responders, and your customer
- eliminate unnecessary patrols due to false alarms
- Increase your RMR and customer retention by adopting innovative solutions designed for your business

The Permaconn Video Verification service delivers video clips directly into all common automation software and requires no additional investment in hardware, or software, for the monitoring centre.

When used with the Permaconn PM54, the Video Verification service can use the PM54's cellular connectivity, or customer's network to capture and retrieve video footage.

An easy-to-use web interface within Atlas, autodetects cameras connected to the NVR or network, and provides a simple interface to map alarm zones to cameras and quickly test all cameras during configuration.

The Video Verification service supports stand-alone cameras and NVRs from common vendors including Dahua, Uniview, Axis and more.

[Contact us](#)

Permaconn is the market leader in mission-critical communications solutions. Our private and secure network allow us to provide end-to-end connectivity services for mission-critical systems including intruder security, camera systems and alarm communication.

Our technology works over IP and digital mobile networks (3G, 4G, and the latest dedicated IoT networks) across multiple network operators.
